What some parents say about Waldorf Education ?

- Restricting access to television and video games stimulates children's curiosity. These advocates argue that without TV or computers, children build a habit of reading and writing in their free time. Research studies support the claim that writing by hand encourages adults to recognize written letters more quickly than they would if they had typed them.
- Children are treated as individuals and curriculum is tailored to their unique style of learning. Students are discouraged from competing and are free to learn at their own pace.
- Children learn the meaning of teamwork and community. Working on group art and theater projects helps them learn collaboration at an early age.
- Waiting until the later grades to teach reading and math promotes long-term achievement. Because brain development occurs at a different pace for each child, the Waldorf approach helps students thrive until their learning skills catch up with their development. What's more, reading and math is approached differently than in traditional schools. Numbers, math symbols, and letters are introduced in first grade through stories so they are less abstract for children.
